Code file:

GNB.java: It contains the source code.

Commands for running the code

To compile:

```
javac GNB.java
```

To Execute:

```
java GNB
```

transactions.txt: It is the input file. It contains all the transaction

amount.txt: It is the input file. It contains the initial amount in the accounts. The account number is sequentially assigned in each branch

Important

- All these files must be present in a folder.
- As account number is sequentially assigned but transaction file is randomly generated output for lots of queries can be Account does not exist. Thus for individual class/method testing, I have given toy input data. (commented lines in GNB.java from 383 to 428)
